DISCLAIMER

*This Molina Clinical Review (MCR) is intended to facilitate the Utilization Management process. It expresses Molina's determination as to whether certain services or supplies are medically necessary, experimental, investigational, or cosmetic for purposes of determining appropriateness of payment. The conclusion that a particular service or supply is medically necessary does not constitute a representation or warranty that this service or supply is covered (i.e., will be paid for by Molina) for a particular member. The member's benefit plan determines coverage. Each benefit plan defines which services are covered, which are excluded, and which are subject to dollar caps or other limits. Members and their providers will need to consult the member's benefit plan to determine if there are any exclusion(s) or other benefit limitations applicable to this service or supply. If there is a discrepancy between this policy and a member's plan of benefits, the benefits plan will govern. In addition, coverage may be mandated by applicable legal requirements of a State, the Federal government or CMS for Medicare and Medicaid members. CMS's Coverage Database can be found on the CMS website. The coverage directive(s) and criteria from an existing National Coverage Determination (NCD) or Local Coverage Determination (LCD) will supersede the contents of this Molina Clinical Review (MCR) document and provide the directive for all Medicare members.*

DESCRIPTION OF PROCEDURE/SERVICE/PHARMACEUTICAL

Computed tomography (CT) scans use X-ray technology and advanced computer analysis to create detailed pictures of your body. A CT scan of the abdomen is a diagnostic imaging test used to help detect diseases of the liver, small bowel, colon and other internal organs and is often used to determine the cause of unexplained pain.

RECOMMENDATIONS

Chronic Abdominal Pain
The initial evaluation of abdominal pain consists of a detailed history and physical examination, appropriate laboratory studies, and frequently non-advanced imaging such as x-ray or ultrasound. The presence of certain “red flags” may preclude the initial performance of non-advanced imaging. In some cases, endoscopy may be the preferred study.

In children under the age of 14, ultrasound should be the initial study performed for evaluation of abdominal pain.

For the majority of clinical conditions, imaging both the abdomen and pelvis is warranted. Imaging can be limited to part of the abdominal cavity for follow up of specific organs or when the pathology is localized to a particular region of the abdominal cavity. A patient’s exposure to ionized radiation can be limited in these instances.

Kidney Stones – Suspected (Abdomen/Pelvic CT is recommended)
Flank pain and +/- hematuria

Kidney Stones – Known or Follow up (Abdomen/Pelvic CT is recommended)
If initial x-ray (KUB) or ultrasound is indeterminate

Hematuria (Abdomen/Pelvic CT is recommended)

Known Tumor or Mass (limited to the upper abdominal cavity only e.g. liver, kidney, adrenal)
- Initial evaluation of a recently diagnosed cancer
- Follow up of a known tumor or mass after completion of treatment or with new signs/symptoms
- Surveillance of a known tumor or mass according to accepted clinical standards.
- For initial staging of prostate cancer with a PSA of 20 or higher or a Gleason score of 7 or higher (either Pelvic CT or Abdomen/Pelvic CT is recommended)

Suspected Tumor or Mass Not Confirmed as Cancer (limited to the upper abdominal cavity only)
- Evaluation of an abnormality seen on x-ray or other imaging
- Evaluation of an abnormality on physical examination and initial evaluation with x-ray or ultrasound has been completed.
- Suspected tumor based on abnormal laboratory test results (e.g. elevated tumor markers)

Infection Suspected (Abdomen/Pelvic CT is recommended)
- Appendicitis, acute abdominal pain with at least one of the following:
  - Nausea/vomiting
  - Fever of at least 100.3 or higher
  - Abdominal rigidity, guarding/rebound tenderness, or other peritoneal signs
  - Elevated white blood cell count (WBC)
• Diverticulitis - Complication of diverticulitis with severe abdominal tenderness or mass, not responding to antibiotics
• Abscess (limited to the upper abdominal cavity only)
  o Any known infection that is clinically suspected to have created an abscess
  o Re-evaluation of an abscess after treatment

Fistula
Evaluation of a known or suspected fistula (limited to the upper abdominal cavity only)

Inflammation
• Suspected pancreatitis (new or recurrent) with abnormal amylase or lipase or severe focal pain.
• Known pancreatitis and concern for pseudocyst formation
• Suspected inflammatory bowel disease (new or recurrent) with abdominal pain, persistent diarrhea or bloody diarrhea (Abdomen/Pelvic CT is recommended)
• CT enterography for evaluation of known inflammatory bowel disease (Abdomen/Pelvic imaging is recommended)

Vascular Disease (aneurysm, etc.) CTA or MRA may be preferred (Abdomen/Pelvic imaging is recommended unless the abnormality is localized to one body region)
• Vascular abnormality seen and indeterminate on other imaging studies
• Aortic Aneurysm and ultrasound is indeterminate or this is for preoperative planning
• Follow up after endograph repair and CTA is not also ordered

Trauma
Suspected abdominal or retroperitoneal hemorrhage (limited to the upper abdominal cavity only)

Weight Loss (Abdomen/Pelvic imaging is recommended)
• Loss of 5% of body weight persisting for 6 months with initial evaluation of a chest x-ray, ultrasound, laboratory testing including TSH, and colon cancer screening (if over 50 years old)
  completed
• Loss of 10% of body weight in less than 2 months with at least one MD visit documenting weight loss

Pre/Post Procedural (limited to the upper abdominal cavity only)
• Pre-operative evaluation
• Post-operative for routine recommended follow up or for potential post-operative complications.
• A repeat study may be needed to help evaluate a patient’s progress after treatment procedure intervention or surgery. The reason for the repeat study and that it will affect care must be clear.

Other
• Evaluation of an abnormality seen on other imaging and the diagnosis remains uncertain
• For evaluation of a known or suspected ventral or incisional hernia
• High Risk - Any patient over 75 y/o or diabetic with persisting pain (not intermittent only) (Abdomen/Pelvic imaging is recommended)
• For the evaluation of suspected organomegaly when initial ultrasound has been completed

ADDITIONAL INFORMATION
The above medical necessity recommendations are used to determine the best diagnostic study based on a patient’s specific clinical circumstances. The recommendations were developed using evidence based
studies and current accepted clinical practices. Medical necessity will be determined using a combination of these recommendations as well as the patient’s individual clinical or social circumstances.

- Tests that will not change treatment plans should not be recommended.
- Same or similar tests recently completed need a specific reason for repeat imaging.
