The Issue:
While a review of the current literature contains numerous publications about the effects of weight loss and exercise as measures in the prevention of type 2 diabetes mellitus, there are fewer studies exploring these measures in people with the disease itself. The literature has shown that lifestyle interventions can result in significant improvements in metabolic and clinical variables in some people with persistent impaired glucose tolerance and type 2 diabetes. A Finnish study concluded that type 2 diabetes is preventable with altered diet and exercise, and a program of high-intensity progressive resistance training and moderate weight loss improved glycemic control and body composition in older subjects. While exercise should be combined with proper diet, we will not discuss dietary recommendations in this issue. The trick for practitioners is to find the time to discuss exercise in detail and get the patient to set some reasonable goals. In addition, a follow-up office visit within a few weeks is very important. Since regular exercise can affect blood glucose levels significantly, adjustment of glucose lowering agents may be necessary to avoid hypoglycemia.

Step by Step:
Motivating Patients To Be Physically Active and Attain Healthy Weight

The Issue:
While a review of the current literature contains numerous publications about the effects of weight loss and exercise as measures in the prevention of type 2 diabetes mellitus, there are fewer studies exploring these measures in people with the disease itself. The literature has shown that lifestyle interventions can result in significant improvements in metabolic and clinical variables in some people with persistent impaired glucose tolerance and type 2 diabetes. A Finnish study concluded that type 2 diabetes is preventable with altered diet and exercise, and a program of high-intensity progressive resistance training and moderate weight loss improved glycemic control and body composition in older subjects. While exercise should be combined with proper diet, we will not discuss dietary recommendations in this issue. The trick for practitioners is to find the time to discuss exercise in detail and get the patient to set some reasonable goals. In addition, a follow-up office visit within a few weeks is very important. Since regular exercise can affect blood glucose levels significantly, adjustment of glucose lowering agents may be necessary to avoid hypoglycemia.

Questions to Assess Patient Readiness and Motivation To Lose Weight:
- What are your goals concerning weight and exercise? Do these seem realistic to you? What behavioral changes are you ready to make right now? (e.g., give up smoking, start an exercise program, change my eating habits)
- Are there any behaviors you do not feel ready to work on right now?
- Have you tried making lifestyle changes before? What has kept you from succeeding in the past?
- Taking into consideration other factors in your life right now, is this a good time to make a serious lifestyle change?
- What is preventing you from exercising? (e.g., unsafe neighborhood, cost, access, support system)
- Can you set a specific date when you will be ready to begin?
- Are you able to devote time each day (e.g., 15-30 min) toward planning and achieving your goals?
- What do you need or want from others to help you succeed? (e.g., support from family and friends, enrollment in an exercise class, transportation to and from Weight Watchers meetings, help with menu planning)
- Do you feel comfortable asking for help? Do you know whom to ask?
- What are you willing to do right now? Let's discuss the specific behaviors you are going to address first (make notes in patient chart).
- How confident are you, on a scale of 1-10, that you will be able to meet each of these goals?
- How can I help you with this? (Provide referrals to other specialists as indicated.)
- Just in case it's needed, what kind of back-up plan can we develop if your plans are not working as well as we hoped?
Resources for Clinicians

The following resources are FREE and can be downloaded from the New Mexico Health Care Takes On Diabetes website at [www.nmtod.com](http://www.nmtod.com). For further information contact Charm Lindblad, Executive Director, at 505.796.9121 or toll-free 1.866.796.9121.

New Mexico on the Move—New Mexico on the Move is a state affiliate of the national program, America on the Move. This coalition has a goal of getting 2% of the state’s population to participate in the program. It is a web-based physical activity and healthy eating challenge. One can log on and access the entire site [http://www.newmexicoonthemove.org](http://www.newmexicoonthemove.org). New Mexico on the Move accomplishes the following:

- Encourages people to do a 6-week Challenge. A short-term commitment is good for beginners.
- Suggests increasing daily steps by 2000, decreasing daily calories by 100 to improve health and stop weight gain.
- Encourages goal setting, record keeping, groups, and using a pedometer for instant feedback - all proven strategies for exercise adherence.
- Incorporates activity and healthy eating for “energy balance” concept.
- Stresses small steps, starting from where you are and increasing activity gradually.
- Provides concrete tips to increase activity and decrease food consumption.
- Participants can log on to a New Mexico specific web site, which can be a further motivation.
